

HAIRSTYLING SCISSORS

ABSTRACT

A pair of hairstyling scissors includes first and second members pivotally connected to each other. Each member includes a cutting portion and a handle portion integral therewith, respectively. The handle portion of the second member is adjustable and includes a thumb receiving member and a pivot mechanism that allows the thumb-receiving member to pivot between first and second positions. Advantageously, the thumb-receiving portion allows a user to freely position his/her thumb into and out of the adjustable handle portion during operating conditions.
